_36 oh that one you mean :-) LTS is still LTS had to restart i guess i was just waiting a couple seconds @cpaelzer: "Stuck"? let me make sure i'm understanding this correctly. If I installed a package that was automatically installed and didn't have to manually install, the package didn't appear in the dpkg -l command. And the package that's manually installed doesn't appear in the dpkg -l command, although it does appear in the Synaptic package manager. Hi, I was wondering if someone can help me. I've never really used the Synaptic package manager so I'm kind of ignorant in the way it works. I have a Sony Xperia Z2 Compact (2017 version). The driver for my phone says that it's using 4.4.2.8.1-6-build 814 on an Android API of API level 24 and up. Is this in fact true? I would appreciate some help with this. you might find some folks in #ubuntu-touch to help you, knee. Oh, thank you for the tip! I've never really used the Synaptic package manager so I'm kind of ignorant in the way it works. pynthor: but you answered your own question there Oh, that's cool. synaptic works by using dpkg -L packageName | grep stuff to view what package it installed It's been some years since I've used the Linux command line. All the time I've used has been spent in windows. like you said, this is #ubuntu Oh, this is a ubuntu command line channel? no, but you are using ubuntu
