AccountConventional tanks for storing hydrocarbon fuels, such as gasoline and diesel fuel, have been generally filled with the fuel to be dispensed through a fixed spout. To maintain the integrity of the liquid storage system, the fixed spout must be periodically removed and replaced. One type of repair that requires that the fixed spout be removed involves repairing a hole that was caused by corrosion or a leak. Known repair methods for replacing a fixed spout include drilling

through the fixed spout and then inserting a spout that is slightly larger than the fixed spout. The inserted spout is then cemented to the fixed spout. Since most conventional tanks have a relatively shallow depth, the spout must be very firmly attached to the tank in order for the spout to remain attached during the transport of the liquid held in the tank. Typically, the spout is attached by cementing it to the tank. However, the cement of the past has not consistently provided a leak-free seal between the spout and the tank, which can lead to undesirable consequences. For instance, the cement has not always performed well
